Iskratel showcases modern and digital transportation solutions at SmartRail Europe 2017

Amsterdam, Netherlands, April 6, 2017 – Iskratel, the leading European infocommunications vendor and solutions provider with more than 70 years of experience in ICT, this week took part in SmartRail Europe 2017, displaying its integrated solutions for the transportation industry which have already been successfully deployed across Europe, Russia and CIS regions.

Iskratel showcased how it can help customers deliver digital transformation in the right way and demonstrated its ICT expertise to transportation organizations looking to deploy modern and digital ICT solutions on top of their current infrastructure.

Iskratel has already seen successful deployments of its transportation solutions, most notably for its Global System for Mobile Communications – Railway (GSM-R) project, an international wireless communication standard for railway communication and applications that transformed Slovenia's national railway ICT network.

“Transportation customers which choose Iskratel to manage their existing communication network will be able to efficiently manage hundreds of thousands of devices in their networks,” said Damjan Slapar, Chief Technology Officer at Iskratel. “The most valuable benefit of our ICT solutions is that they can be deployed on to companies’ existing infrastructure, meaning only gradual investments are needed when implementing new voice, video and data services to your existing system.”

Iskratel's infocommunications solutions for transportation deliver an increased level of security, lower operational costs and increased end-user satisfaction through integrating unified IP communications systems with existing technologies. The benefits offered by Iskratel's solutions also enable reliable and smooth migration to new technologies and services.
